

# Cow Brush

Cow Brush

Cowbrush specially designed for installation in barns. When a cow touches the brush, the brush automatically brushes the cow. Through a rotating motion of the synthetic brushhairs it can cover even the most difficult places like the head, the back and tailimplant. So it has a better coverage as the shuttle system.

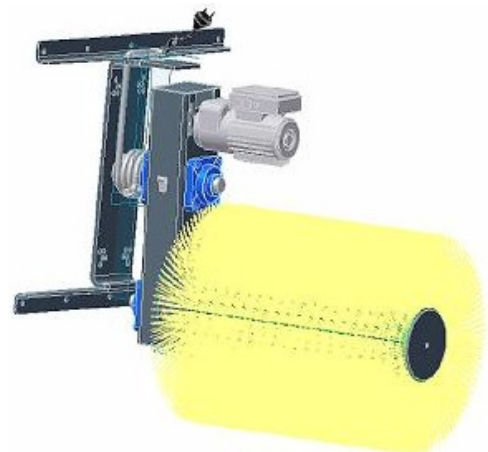

**The Cowbrush has a lot to offer:**

## Advantages

- ⇒ Stimulates the bloodcirculation, result is a healthier skin.
- ⇒ Gives rest in the barn, what results in a higher (milk)yield.
- ⇒ Minimum wear because of ball-bearings.
- ⇒ Special way of installation of the brushhairs, so they do not fall off and get in the manure.
- ⇒ Easy to install.
- ⇒ Low maintenance.
- ⇒ Safe and comfortable.
- ⇒ Low power.

## Usage

When a cow touches the brush, the brush hinges. A circuit is being made and the brush starts rotating. The circuit has a time-delay, which assures that the brush keeps on rotating, even when it passes his restingpoint. Our cowbrush is being made for years already, therefore it is a very reliable and secure product.

## Technical Details:

- ⇒ High efficiency 220 V electric motor with raised torque.
- ⇒ High efficiency gear-reductor with cutted gearsides.
- ⇒ On– off-switch and security are solid state (no mechanical contacts).
- ⇒ Motor with build-inn sensor for temperature-control in the motor.
- ⇒ All electrical components are build in the motor-casing.
- ⇒ Maximal power-usage is 0,12 kWh.
- ⇒ Harder layers of paint because of powdercoating.
- ⇒ Installationsprocket has several holes, which ensures easy installation.
